

## Colorectal Cancer

March is National Colorectal Cancer Awareness Month, a time to educate ourselves about colorectal cancer and the importance of regular screening.

Colorectal cancer is the second leading cause of cancer deaths in the U.S. According to the Centers for Disease Control and Prevention (CDC), if everyone age 50 years or older had regular colon screenings, deaths from this disease could be reduced by almost 60% <sup>(1)</sup>.

Common symptoms of colorectal cancer can include <sup>(1,2)</sup>:

- Blood in or on the stool
- Stools that are narrower than usual
- Change in bowel habits
- Frequent gas, stomach pains, or indigestion
- Unexplained weight loss
- Chronic fatigue

According to the American Cancer Society, there are several factors that may increase your risk of developing colorectal cancer; they include <sup>(1,3)</sup>:

- Age and diet
- Certain racial and ethnic groups (African American and Ashkenazi Jews)
- Inflammatory bowel disease

- Personal or family history of colorectal polyps or colorectal cancer
- Certain hereditary syndromes
- Type 2 diabetes
- Tobacco and heavy alcohol use
- Physical inactivity and obesity

Colorectal cancer usually develops from precancerous polyps in the colon or rectum and may not show any symptoms. Colorectal cancer screening is one of the most effective ways to prevent this type of cancer because screening can often detect these polyps early, when treatment works best <sup>(1,3)</sup>.

You should begin screening for colorectal cancer soon after turning 50 and continue screening at regular intervals. There are several [screening tests](#) available; they include: fecal occult blood test (FOBT); flexible sigmoidoscopy; colonoscopy; and double-contrast barium enema <sup>(1)</sup>.
